

Glufosinate status in the US

- Registered uses in USA:
 - Soy, Cotton, Corn, Canola, tree fruit, tree nuts, stone fruit, vine, sweet corn, potato (vine dessication) and olive
- Registration Review started in 2008
- EPA recently (July 2016) proposed the interim registration decision
 - favorable decision but chronic risk cup remained at 98% (main contributor rice)
- Bayer agreed to cancel the rice use - chronic risk cup drops to about ~43%
- **Bayer supports new glufosinate proposals with sufficient crop safety data and the appropriate application timing**
